

Cavcom Introduces Metal Detectable Silicone Earplug

Katie Macke

Our innovative industrial hearing protection line *EarzON®* has a new addition. For more than 25 years, we have been developing technologies to maximize hearing conservation program success for all industries. *EarzON®* now provides a variety of effective hearing protection options for the food industry and other manufacturing operations needing tight protocols for product contamination.

Two metal detectable custom hearing protection options are available from *EarzON®*: an acrylic earplug with metal BB and the [NEW metal detectable silicone](#); both options are paired with a metal detectable lanyard. The innovative silicone material contains special additives that activate metal detection equipment and are visible in traditional X-ray units. In addition, users can expect the same tremendous quality, comfort, and hearing protection we have provided for more than a quarter century.

Noise reduction values can be tailored to the noise levels in your work environment. Our specially designed [acoustic filters](#) reduce sounds evenly across a wide frequency range. The filters allow you to turn down the volume (noise) without sacrificing listening quality (the sounds you want to hear - warning signals, speech, etc.).

Via a complete collaboration effort with safety & health personnel, management, and end-users, we customize our hearing protection solutions to meet the specific needs of each individual worker and environment. All customer service needs are also handled directly by us to ensure absolute customer satisfaction. Product demonstrations are available onsite, as well as online, upon request. [Contact us](#) today for information on metal detectable hearing protection.
